IS 445 - Data Visualization - Weekly Report 12

The above visualization is something that we may have never seen before. It depicts the number one bad habit that is common among majority of the people - biting the nails.

It shows the 4 different instances when people tend to bite nails versus the length of the nail bitten in millimetres. It is seen that the nail biting is most common when people watch scary movies and their hear beats. In contrast to this, when people greet with high fives, there is no sense of anxiousness and so no nail biting happens. Instances when people have meetings/presentations or are on their first date also show some amount of nervousness and hence the nail biting.

I like the way they have used the image of a hand with full or cut nails to represent the idea of nail biting. It is visually intuitive and easy to relate to. The length dimension at the bottom is good but the numbers are not legible. The thumb could also have been used to represent some kind of scenario.
